The program eliminates physical bad sectors on the hard drive surface. He doesn't hide bad sectors, he really restores them! The main benefits of HDD Regenerator hard disk drive is an integral part of every computer. It stores all your information. One of the most common hard drive defects is the poor sector on the surface of the drive. Bad sectors are part of the surface of the disk, which contains unreadable but often necessary information. As a result of bad sectors, you may have difficulty reading and copying data from your drive, your operating system becoming unstable and finally your computer may not be able to load at all. When the hard drive is damaged with bad sectors, the drive not only becomes unusable, but also you risk losing the information stored on it. HDD Regenerator can repair damaged hard drives without affecting or altering existing data. As a result, previously unreadable and inaccessible information is restored. How it works HDD Regenerator regenerates bad sectors through magnetic reversal. This technology is hardware independent, it supports many types of hard drives and repair damage that even low-level disk formatting cannot recover. Due to the way the repair is, the existing information on the disk will not be affected! The minimum system requirements of the product can be set on Windows XP/Vista/7, and it is designed for: 1. Start the regeneration process directly under Windows 2. Create a download of regenerative flash or CD/DVD to start the process of regeneration under DOS if you can't download your computer to Windows (no operating system is installed on your computer or System corrupted), install HDD Regenerator on any computer with Windows XP/Vista/7 operating system and create a download of regenerative flash or bootable CD/DVD regeneration, and then download a computer with that flash/CD created to start starting Supported file systems product works exclusively on a physical level. It ignores the file system and can be used with FAT, NTFS or any other file system, as well as with non-format or unrelated drives. During regeneration, the disk structure will not be changed and existing data will not be affected. Because the product does not change the logical structure of the hard drive, the file system may contain previously marked bad sector labels, even if the hard drive is already regenerated and undamaged by bad sectors. If you want to remove these signs, repartition hard drive installation and uninstalling In order to install an HDD regenerator, perform a file installation. The master installation will help you get through the installation stages. When the installation is complete, click the Finish button to close the Masters. If you need to remove the HDD Regenerator from your computer, use applet programs and features (Add/Delete programs) from the Windows control panel. How to start an HDD Regenerator In order to start a product, double-click the HDD Regenerator icon on your desktop or select the HDD Regenerator icon from the Start menu. If you use an unregistered version, you can only regenerate one recoverable bad sector. The main purpose of the unregistered demo is to display a report that contains information about the possibility of regeneration of the disk with the registered full version. The registered version carefully scans the surface of the hard drive and regenerates all the bad sectors found recoverable. To start the regeneration process, start the HDD Regenerator Console app. You can start the console app directly from Windows (Regeneration Start Process Under the Windows Menu) or create a downloadable regenerative flash (Regeneration Create Bootable Flash Menu) or create a boot regenerating CD/DVD (Regeneration Create a Bootable CD/DVD menu). Once you've created a flash or CD, download your computer from that flash/CD, and the console app will automatically run under DOS. Working with the HDD Regenerator console app to launch the console app, use the Regeneration Start Process under the Windows menu or download from the Bootable Regeneration Flash (Regeneration Create bootable Flash menu) or downloads from the Bootable Regenerating CD/DVD (Regeneration Create Bootable CD/DVD menu) after launching the console app 1. Select drive to regenerate 2. Select mode (Scan and repair or scan only) 3. Enter the Start Sector option. Leave this option to 0 if you want to scan the entire disk. Enter the value of the sector if you want to scan the drive not from the start. For example, you don't want to scan the first 5GB of the hard drive to save time because you know that this part of the surface doesn't contain bad sectors. In this case, enter a bias equal to 5000 with 'm' following or 10240000 without 'm' (Number of sector sectors 4. Wait until the scan is complete. NOTE: If you've started a console app under Windows and the console doesn't respond to keyboard input, make sure it has a focus (click on the console window or use a combination of ALT-TAB keys to switch between windows) HDD Regenerator can recover physical bad sectors caused by magnetic errors on the hard drive surface. If the hard drive has a physical tear (damaged heads, printed board, etc.), then it will not be repaired by the product. Unfortunately, the repair mode directly under Windows won't be effective if you only have one hard drive in your system. The reason is that the repair mode requires exclusive access to the hard drive (except Windows XP). For obvious reasons, exclusive access cannot be obtained to the hard drive on which Windows is installed. This is only due to the repair mode. Scan mode does not require exclusive access to the disk. To get exclusive access to any hard drive in any system, please use the Bootable Regenerating Flash or CD/DVD option.
